

Creating smart, green and liveable cities

Cities account for 70% of global CO₂ emissions. As the pace of urbanisation only quickens, cities face immense challenges related to sustainable waste management, mobility, climate adaptation and energy.

The transition to sustainable cities depends on social, cultural, economic and climatic factors. In the fast-growing cities of developing economies, basic needs such as energy, water, and mobility should be met sustainably, while resources are managed effectively. In cities located in more developed economies, smart approaches are needed to ensure that cities are optimised for economic activity, energy consumption and environmental impact.

Regardless of a city's particular state of development, ensuring 'the good life' for urban citizens should be a guiding principle.

**We need to create smart, green
and liveable cities – Together!**
