

Transport

As one of the world's largest shipping nations, Denmark significantly contributes to global decarbonisation efforts not only within the maritime sector but also as a key partner in the deployment of offshore wind, green fuels and new carbon capture and storage projects. Finding ways to overcome regulatory, financial, technological, and political barriers, Denmark actively seeks global collaboration to ensure that electrification, fossil-free aviation and green shipping can be sustainably scaled across the world.

2023

In 2023, the world's first container vessel to sail on green methanol was launched in Denmark (Laura Mærsk).

100%

Denmark has ambitions of 100% green fuels on board domestic flights by 2030.
